## A Radio Mesh Network

Several device types are available, from all-in-one devices, to barebones components, and modular platforms with multiple sensors and sub-components.

## A Mesh Radio Network

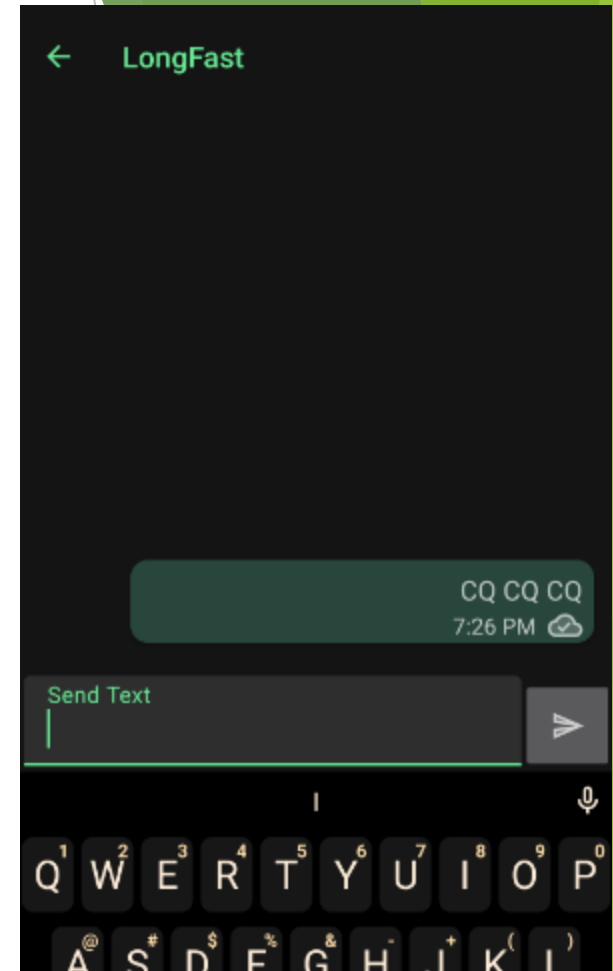

### WHAT IS MESHTASTIC?

MT is a **FREE APP** for sending texts when cellular networks are not available.

MT implements a **MESH ROUTING** network\* on the **915 MHz band in the USA**, where the radios automatically link with each other to find the best path through the network.

MT technology is still very new, and infrastructure is not completely built-out yet, so **MT should not be considered a consumer-level application**.

\*Mesh routing sends a text packet that is potentially heard by several other devices. All radios hearing the packet, **EXCEPT CLIENT\_MUTE** devices, repeat it (with or without call sign), then decrement the hop count by one.

## A Mesh Radio Network

### WHAT IS MESHTASTIC MODULATION AND PROTOCOL?

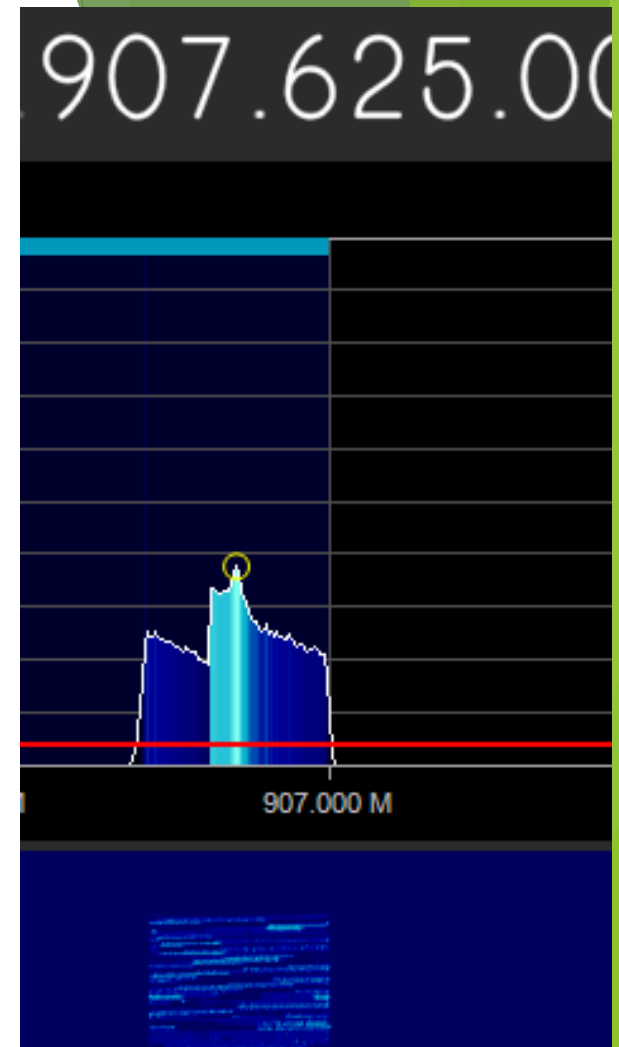

LoRa means **Long Range**! Current 'ground' record is **203 miles** using 250 mW with 2.8dB antennas from mountaintop to distant mountaintop.\*

Utilizes the LoRa Peer-to-Peer '**CHIRP**' modulation technique [**NOT LORAWAN**] on the 915 MHz band in USA / 868 MHz band in Europe.

Meshtastic can use several different bandwidths and spreading factors, but our local deployment will utilize the default "LongFast" modem settings at 250 KHz bandwidth (spread spectrum) for repeaters and gateway nodes.

**UNLICENSED MODE IS PROHIBITED ON 433 MHz IN USA!!**

## A Mesh Radio Network

### WHAT IS MESHTASTIC UNLICENSED MODE vs. LICENSED MODE?

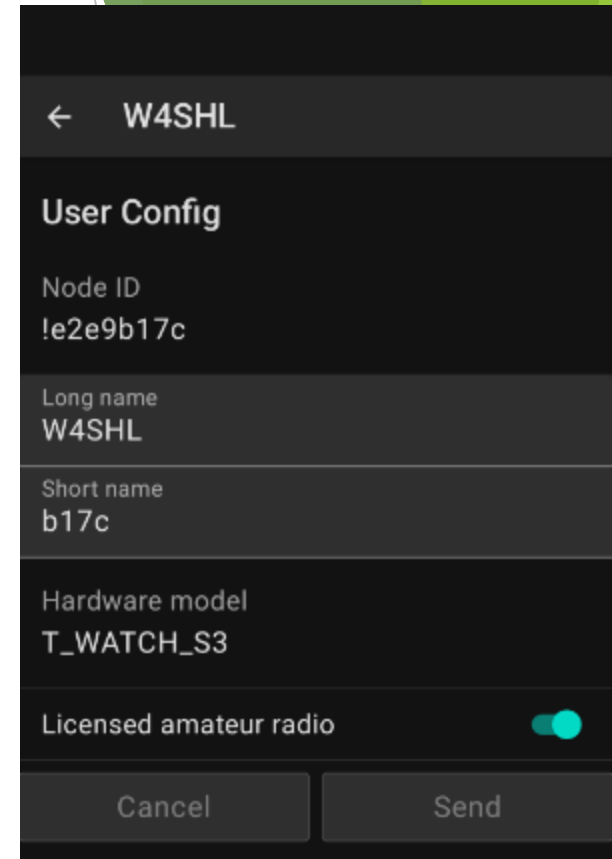

MT can be used in low power **UNLICENSED MODE** (< 4W EIRP) as FCC Part 15 “IOT” devices under Industrial, Scientific and Medical [ISM] rules.

MT can utilize **AES256 ENCRYPTION LEGALLY** in UNLICENSED ISM mode.

MT can also be used in **LICENSED AMATEUR RADIO MODE** under FCC Part 97 by setting a device’s “Long Name” as its station callsign.\*

Enabling Licensed amateur radio mode disables encryption.

\*Best practice may be to **remove any/all encryption keys** when operating a device in Licensed amateur radio mode to remove all doubt.

## A Mesh Radio Network

### WHAT DOES MESHTASTIC DO BESIDES TEXTING?

MT devices that are heard by a user's radio show up in the app's "Node" list.

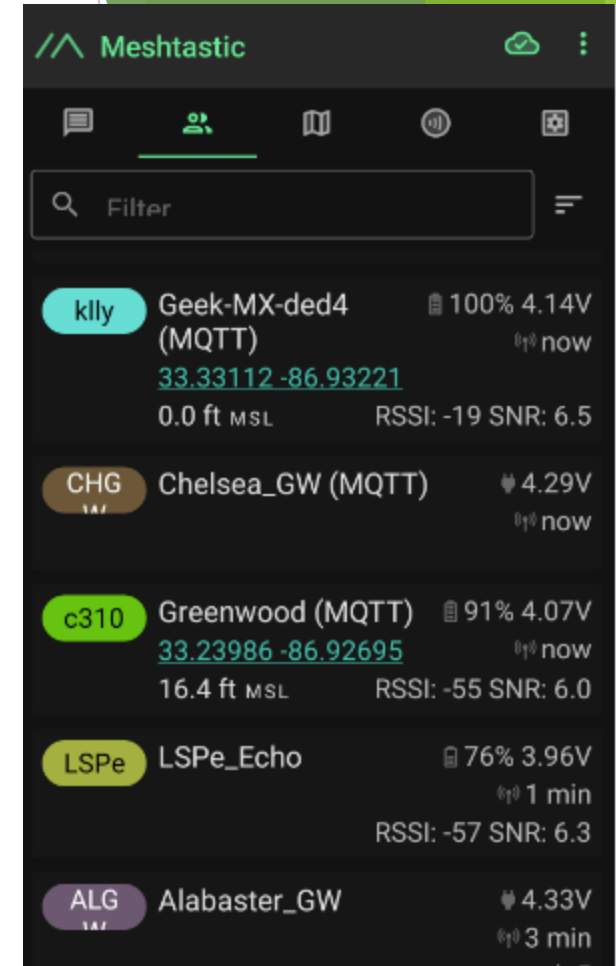

GPS coordinates can be published via the network or **GPS CAN BE DISABLED**.\*

MT can be utilized by **ATAK** as a platform to facilitate situational awareness to coordinate teams for RF Fox Hunting events or for search-and-rescue.

MT CAN **UTILIZE THE INTERNET BUT DOES NOT RELY UPON THE INTERNET**.\*\*

\*Not all MT devices contain GPS receivers; however, GPS coordinates may be provided by a phone that is connected via Bluetooth/BLE, if desired.

\*\*If Internet service becomes unavailable for a Gateway device, it continues functioning as a Repeater, repeating the packets it receives.

# MESHTASTIC

## A Mesh Radio Network

### WHAT ARE THE BENEFITS OF MESHTASTIC UNLICENSED MODE?

MT Routers and Repeaters in unlicensed mode **blindly repeat both licensed and unlicensed traffic** such that the call sign of a packet originally sent in licensed mode always rides along with the traffic being repeated.

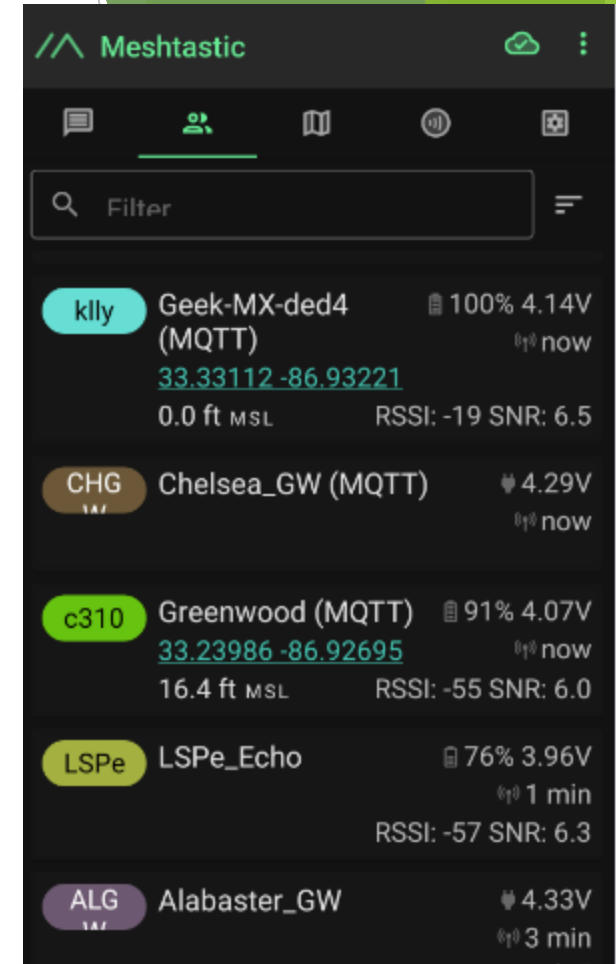

MT can be utilized by family members who may never become licensed amateur radio operators.

MT may spark an interest in getting licensed for the amateur radio hobby.

MT devices, and the application itself, are easy to use, building on the familiar texting paradigm.

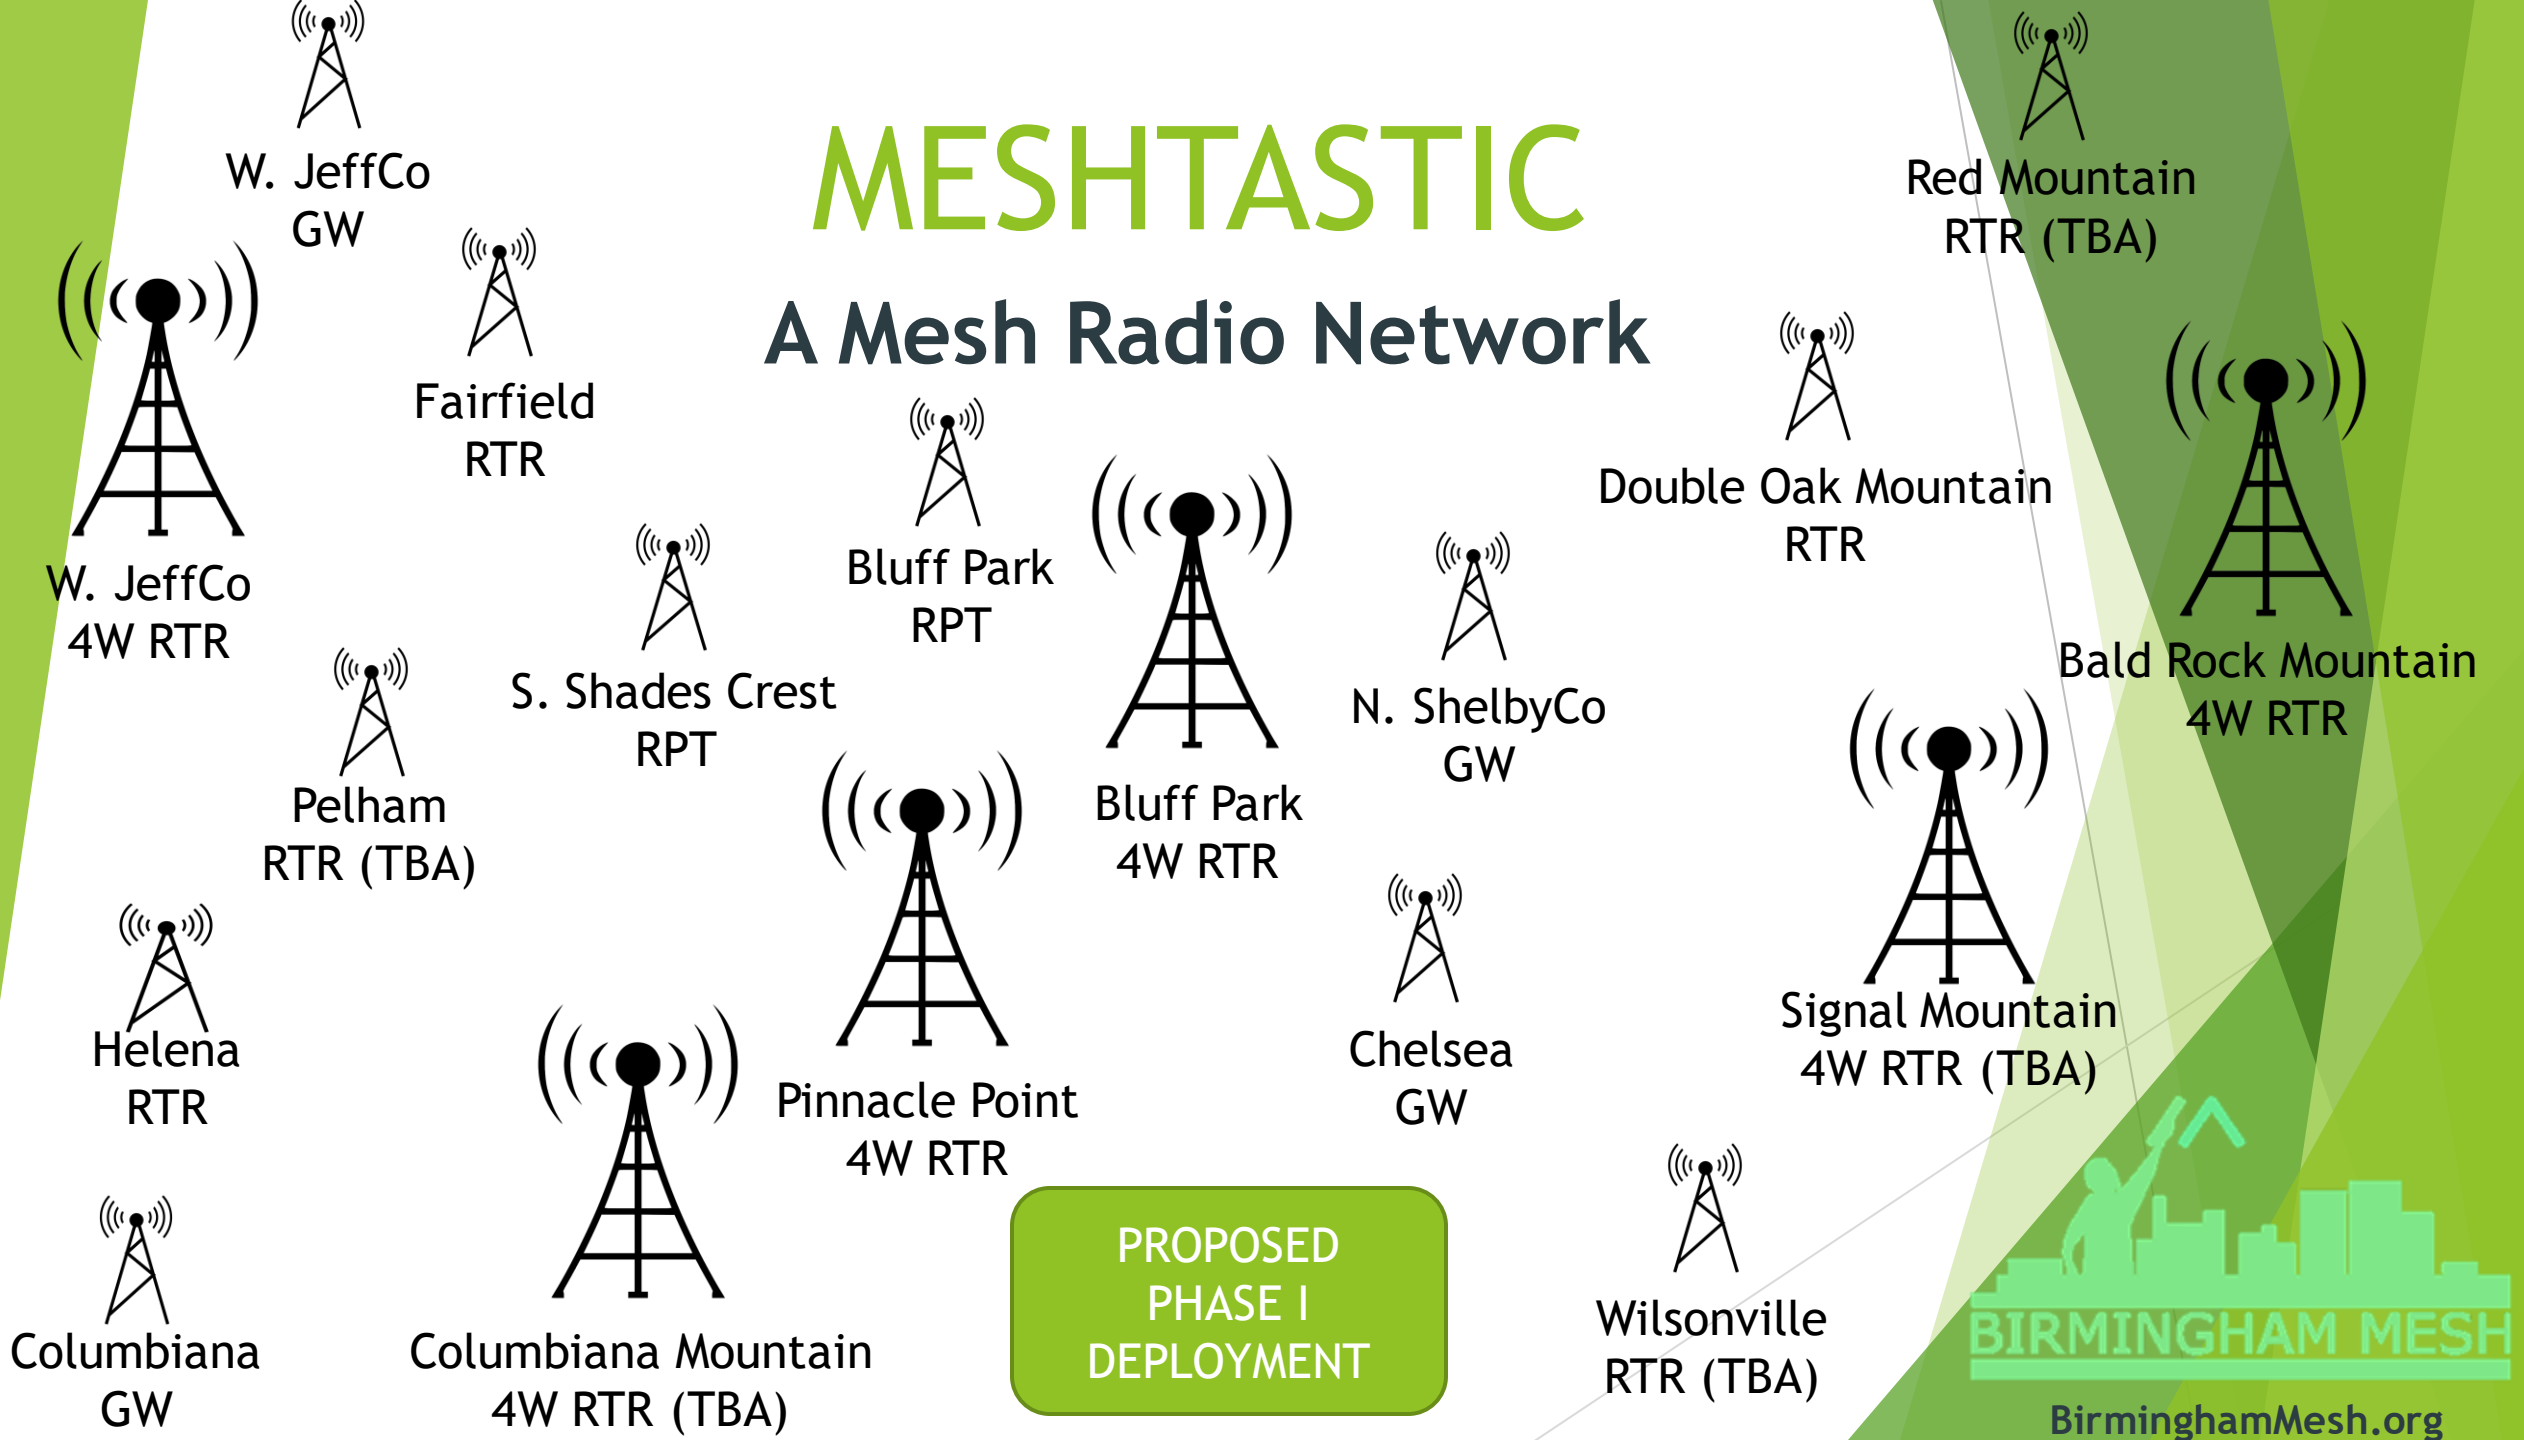

MT, in unlicensed mode, may potentially be allowed as IOT traffic, in the event radio silence is imposed on amateur radio operators, as was done during World War II ←

Personal device configuration is easy, with no need to understand routing.
